Automorphic Forms

On Thursday, November ,26 2015

At 14:10 – 16:00

In Room

Prof. Eyal Kaplan (Ohio State University.)

will talk about

The metaplectic Shalika model and symmetric square L-function

Abstract: One of the pillars of the Langlands program is L-functions. We will recall Artin's L-functions, then briefly describe the modern automorphic point of view. One of the tools frequently used in the study of group representations and L-functions is called a model. Roughly speaking, a model is a unique realization of a representation in a convenient space of functions on the group. We will present a novel model: the metaplectic Shalika model. This is the analog of the Shalika model of $GL(2n)$ of Jacquet and Shalika. One interesting representation having this model is the so-called exceptional representation of Kazhdan and Patterson of a cover of $GL(n)$, which is the analog of the Weil representation. This representation is truly exceptional. We will describe it and its role in the study of the symmetric square L-function, and related problems.
