BGU Probability and Ergodic Theory (PET) seminar

On Thursday, March ,14 2019

At 11:10 – 12:00

In 101-

David Lipshutz (Technion)

will talk about

Pathwise derivatives of reflected dffusions

Abstract: Reflected dffusions (RDs) constrained to remain in convex polyhedral domains arise in a variety of contexts, including as heavy traffic limits of queueing networks and in the study of rank-based interacting particle models. Pathwise derivatives of an RD with respect to its defining parameters is of interest from both theoretical and applied perspectives. In this talk I will characterize pathwise derivatives of an RD in terms of solutions to a linear constrained stochastic dffierential equation that can be viewed as a linearization of the constrained stochastic dffierential equation the RD satisfies. The proofs of these results involve a careful analysis of sample path properties of RDs, as well as geometric properties of the convex polyhedral domain and the associated directions of reflection along its boundary.
