Structure of crossed product C^* -algebras

Abstract: Consider a dynamical system, and let us study the structure of the corresponding crossed product C^* -algebra, in particular on the classifiability, comparison, and stable rank. More precisely, let us introduce a uniform Rokhlin property and a relative comparison property (these two properties hold for all free and minimal Z^d actions). With these two properties, the crossed product C^* -algebra is shown to always have stable rank one, to satisfy the Toms-Winter conjecture, and that the comparison radius is dominated by half of the mean dimension of the dynamical system.
