

## The Department of Mathematics

2018–19–B term

**Course Name** Fourier Analysis

**Course Number** 201.1.0231

**Course web page**

<https://www.math.bgu.ac.il/en/teaching/spring2019/courses/fourier-analysis>

**Lecturer** Prof. Eitan Sayag, <sayage@bgu.ac.il>, Office 107

**Office Hours** <https://www.math.bgu.ac.il/en/teaching/hours>

### Abstract

### Requirements and grading<sup>1</sup>

### Course topics

- Cesaro means: Convolutions, positive summability kernels and Fejer's theorem.
- Applications of Fejer's theorem: the Weierstrass approximation theorem for polynomials, Weyl's equidistribution theorem, construction of a nowhere differentiable function (time permitting).
- Pointwise and uniform convergence and divergence of partial sums: the Dirichlet kernel and its properties, construction of a continuous function with divergent Fourier series, the Dini test.
- $L^2$  approximations. Parseval's formula. Absolute convergence of Fourier series of  $C^1$  functions. Time permitting, the isoperimetric problem or other applications.
- Applications to partial differential equations. The heat and wave equation on the circle and on the interval. The Poisson kernel and the Laplace equation on the disk.

---

<sup>1</sup>Information may change during the first two weeks of the term. Please consult the webpage for updates

- Fourier series of linear functionals on  $C^m(\mathbb{T})$ . The notion of a distribution on the circle.
- Time permitting: positive definite sequences and Herglotz's theorem.
- The Fourier transform: convolutions, the inversion formula, Plancherel's theorem, Hermite functions. Time permitting: tempered distributions, further applications to differential equations.
- Fourier analysis on finite cyclic groups, and the Fast Fourier Transform algorithm.
