

Isoperimetry, Littlewood functions, and unitarisability of groups

Let Γ be a discrete group. A group Γ is called *unitarisable* if for any Hilbert space H and any uniformly bounded representation $\pi : \Gamma \rightarrow B(H)$ of Γ on H there exists a bounded operator $S : H \rightarrow H$ such that $S^{-1}\pi(g)S$ is a unitary representation for any $g \in \Gamma$. It is well known that amenable groups are unitarisable. It has been open ever since whether amenability characterises unitarisability of groups.

Dixmier: Are all unitarisable groups amenable?

One of the approaches to study unitarisability is related to the space of the Littlewood functions $T_1(\Gamma)$. We define the **Littlewood exponent** $\text{Lit}(\Gamma)$ of a group Γ :

$$\text{Lit}(\Gamma) = \inf \{p : T_1(\Gamma) \subseteq \ell^p(\Gamma)\}.$$

We will show that, on the one hand, $\text{Lit}(\Gamma)$ is related to unitarisability and amenability and, on the other hand, it is related to some geometry of Γ .

We will discuss several applications of this connection. This is a joint work with Dominik Gruber, Nicolas Monod and Andreas Thom.
